

Delhi Metro App Redesign: A Seamless Journey

A comprehensive UX redesign initiative — reimagining how millions of daily commuters plan, navigate, and travel across India's largest metro network.

INFORMATION ARCHITECTURE

WIREFRAMES

The Current Commuter's Challenge

The existing Delhi Metro app is letting its users down. With a low average rating of **3.2 stars**, the app suffers from persistent usability issues, sluggish performance, and a confusing interface that creates unnecessary friction for millions of daily commuters.

Journey Planning

Users struggle to find routes, timings, and fare information efficiently.

Station Information

Critical station details are buried under layers of unclear navigation.

Card Management

Recharging and managing travel cards is unnecessarily complex and time-consuming.

Unpacking the Problems: A Deeper Look

A thorough audit of the existing application revealed a consistent pattern of design and usability failures that compound the commuter's daily frustration.

Visual Overload

Outdated splash screens, overcrowded home layouts, and monotonous grey tones create immediate visual fatigue upon launch.

Poor Prioritisation

No clear action hierarchy on the home screen — users cannot quickly identify the most essential functions.

Accessibility Gaps

Insufficient colour contrast ratios and inconsistent iconography exclude users with visual impairments.

Intrusive Advertising

Advertisements placed directly on transactional and safety-critical pages disrupt core user tasks at the worst possible moments.

Information Architecture: Structuring for Clarity

A well-structured information architecture forms the backbone of the redesign. By reorganising content into logical, user-mental-model-aligned groupings, the app becomes immediately intuitive — reducing cognitive load and enabling faster access to critical features.

Each of the five primary navigation sections is designed to be accessible within **two taps** from the home screen, drastically reducing the time to complete core commuter tasks.

User Flow: Mapping the Commuter's Path

Four critical user journeys were mapped and optimised to eliminate unnecessary steps and reduce decision fatigue. Each flow follows a linear, goal-oriented structure guided by clear visual cues.

Journey Planning

Enter origin → Select destination → View route options with fares and timings → Confirm journey.

Card Recharge

Select card → Choose top-up amount → Choose payment method → Receive instant confirmation.

Nearest Station

Enable location → View nearest stations on map → Select station → Access real-time information.

Emergency SOS

One-tap SOS from any screen → Auto-share location → Connect to DMRC helpline instantly.

Mid-Fidelity Wireframes: Visualising the Solution

Mid-fidelity wireframes translate the information architecture and user flows into tangible screen layouts. The focus at this stage is on **content hierarchy, spacing, and interactive element placement** — before committing to final visual styling.

Home Screen

Prioritised quick-access tiles for Route Planner and Card Balance at the top fold, with service alerts below.

Route Planner

Clean two-field input with autocomplete, followed by scannable route cards showing time, fare, and interchanges.

Station Details

Tabbed layout covering Facilities, Exits, Parking, and Live Departures in a single, scrollable view.

Card Recharge

Step-indicator at the top with a distraction-free flow — no advertisements on payment screens.

Key Design Enhancements

Modern Aesthetics

Updated colour palette inspired by DMRC's official branding — deep blues and vibrant accents replace the dull grey monotony. The **Urbanist typeface** brings clean, modern legibility across all screen sizes.

Consistency System

A unified icon library and component design system ensures visual coherence across every screen and interaction state.

Enhanced Features Introduced

- **Parking Availability** — Real-time data on parking spaces at each station
- **Know Your Station** — Rich station profiles with exit maps and nearby landmarks
- **Smart Notifications** — Personalised alerts for delays, platform changes, and card balance reminders

Accessibility Focus

All UI elements meet **WCAG 2.1 AA** contrast standards. Icon labels, larger tap targets, and screen-reader compatibility are built in from the ground up.

The Redesigned Experience: Smoother, Smarter, Faster

The redesigned Delhi Metro app places the commuter at the absolute centre of every decision. The result is an experience that feels effortless — one that works *with* the user, not against them.

2x

Faster Navigation

Core tasks completed in half the number of taps versus the original app.

40%

Reduced Friction

Estimated reduction in user drop-off during the journey planning and recharge flows.

100%

Ad-Free Transactions

Zero advertisements on any payment or safety-critical screen.

Impact and Future Potential

A well-executed redesign goes far beyond aesthetics — it creates measurable value for commuters, the DMRC organisation, and the broader public transport ecosystem across India.

Higher Ratings & Adoption

Improved usability translates directly to better App Store and Play Store ratings, driving organic downloads and daily active users among Delhi's 5 million+ daily commuters.

Operational Efficiency

Fewer customer support queries, reduced token window footfall, and increased digital card recharges generate measurable cost savings for DMRC operations.

A National Benchmark

This redesign sets a new standard for public transport digital experiences across India, offering a replicable model for metro systems in Mumbai, Bengaluru, and beyond.

Thank You

This redesign represents a commitment to making public transport more accessible, efficient, and enjoyable for every commuter in Delhi. We welcome your thoughts, feedback, and questions.
